Figure 1. The effect of the number of trials on the mean accuracy of the responses ($n = 10$) as a function of the number of items ($n = 8$). Error bars represent standard error of the mean.

Abstract

Figure 1 consists of three bar charts. The first chart shows the percentage of respondents who answered 'No' to the question 'Do you have a good understanding of the risks of the use of mobile phones?' for three age groups: 18-24, 25-34, and 35-44. The percentages are approximately 10% for 18-24, 15% for 25-34, and 20% for 35-44. The second chart shows the percentage of respondents who answered 'Yes' to the same question. The percentages are approximately 85% for 18-24, 80% for 25-34, and 75% for 35-44. The third chart shows the percentage of respondents who answered 'Don't know' to the same question. The percentages are approximately 5% for 18-24, 5% for 25-34, and 5% for 35-44.

Abstract The purpose of this study was to determine whether there were differences in the prevalence of self-reported depression between men and women who had been exposed to violence during childhood and adulthood. Data from the National Longitudinal Study of Adolescent Health (*N = 9,800*) were used to examine the association between exposure to violence and self-reported depression among adolescents. Results showed that exposure to violence during childhood and adulthood was associated with higher rates of self-reported depression. Furthermore, the association between exposure to violence and self-reported depression was stronger for women than for men.

Figure 1 consists of two line graphs side-by-side, both plotting percentages (0 to 100) on the y-axis against years (2007 to 2011) on the x-axis. The left graph shows 'Strongly agree' (solid line with circles) and 'Disagree/Strongly disagree' (dashed line with squares). The right graph shows 'Somewhat agree' (solid line with circles) and 'Somewhat disagree' (dashed line with squares). In both graphs, the 'agree' lines show an upward trend while the 'disagree' lines show a downward trend over the period.

Year	Strongly agree	Disagree/Strongly disagree	Somewhat agree	Somewhat disagree
2007	45	55	65	35
2008	50	50	70	30
2009	55	45	75	25
2010	60	40	80	20
2011	65	35	85	15

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher than the number of incorrect responses in all cases. The number of correct responses was significantly higher than the number of incorrect responses in all cases.

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).
